

Plan API Specifications

This is perhaps the most open ended part of the project. The task here is to plan out the API endpoints of the application and what each endpoint will do. This is NOT something that will be set in stone as when you work through the project you may have (and will) tweak, adapt, and change the application according to your needs and new ideas. But it's important to have a GENERAL plan on how your "front-end" will "talk" to the "back-end" of your application. Going back to the "Fantasy Football" idea... What route needs to be there if we want to "view all teams"? What route needs to be there if we want to "add a player"?

Let's follow through with our examples with "Facebook for Dogs (and Their Owners)" and take a look at just one of the ways at how we could plan out our API routes for this application:

Example API Plan for the DogAPP:

https://docs.google.com/document/d/1cQCZzJvHIZoT0QQ_msZHpB3J1s5cjt-6QsDjw4A86sk/edit?usp=sharing

Feel free to share the API outline / plan to your mentor. You can use GoogleDocs to share your API outline. Discuss your approaches, endpoints, and / or functionality. It is up to you if you take a more traditional RESTful approach, or a GraphQL centered solution. The shape and/or complexity of the API will be different depending on the project.

Once you have the core functionality implemented, you'll focus on additional UI enhancements and styling for your application. This is where you will implement your bells and whistles.

Note: Do not submit your project for formal grading until the entire project is complete.
